

## 2E2 Tutorial Sheet 9<sup>1</sup>

8 January 2006

### Useful facts:

- Working out the eigenvalues of a  $2 \times 2$  matrix: say your matrix is

$$A = \begin{pmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{pmatrix} \quad (1)$$

then the characteristic equation is

$$\det(A - \lambda \mathbf{1}) = \begin{vmatrix} a_{11} - \lambda & a_{12} \\ a_{21} & a_{22} - \lambda \end{vmatrix} = (a_{11} - \lambda)(a_{22} - \lambda) - a_{12}a_{21} = 0 \quad (2)$$

The eigenvalues  $\lambda_1$  and  $\lambda_2$  are the two solutions of this equation.

- Working out the eigenvectors: say  $\lambda_1$  is an eigenvalue of the  $2 \times 2$  matrix  $A$  then to work out the eigenvector  $\mathbf{x}_1$  corresponding to  $\lambda_1$  let

$$\mathbf{x}_1 = \begin{pmatrix} a \\ b \end{pmatrix} \quad (3)$$

and solve the equation

$$A\mathbf{x}_1 = \lambda_1\mathbf{x}_1 \quad (4)$$

Doing out the matrix multiplication will give you two equations, but, all being well these will usually be the same equation so all you can do is solve  $a$  in terms of  $b$  or visa versa. To get a particular eigenvector you can choose  $a$  or  $b$  to be one.

- Solving a linear differential equation: for  $A$  a  $2 \times 2$  matrix with eigenvalues  $\lambda_1$  and  $\lambda_2$  and corresponding eigenvectors  $\mathbf{x}_1$  and  $\mathbf{x}_2$  then if

$$\mathbf{y}' = A\mathbf{y} \quad (5)$$

the solution is

$$\mathbf{y} = C_1\mathbf{x}_1e^{\lambda_1 t} + C_2\mathbf{x}_2e^{\lambda_2 t} \quad (6)$$

where  $C_1$  and  $C_2$  are arbitrary constants.

### Questions

- (3) Find the eigenvectors and eigenvalues of the following matrices

$$(i) \begin{pmatrix} 10 & -4 \\ 18 & -12 \end{pmatrix} \quad (ii) \begin{pmatrix} 4 & 0 \\ 0 & -6 \end{pmatrix} \quad (iii) \begin{pmatrix} 0 & r \\ r & 0 \end{pmatrix} \quad (7)$$

- (2) Find the eigenvectors and eigenvalues of the following matrices

$$(i) \begin{pmatrix} 3 & 4 \\ 4 & -3 \end{pmatrix} \quad (ii) \begin{pmatrix} 0 & 3 \\ -3 & 0 \end{pmatrix} \quad (8)$$

- (3) Find the solution for the system

$$\frac{dy_1}{dt} = -3y_1 + 2y_2 \quad (9)$$

$$\frac{dy_2}{dt} = -2y_1 + 2y_2 \quad (10)$$
