

# The Markov Property<sup>1</sup>

24 February 2012

The random variables  $X$ ,  $Y$  and  $Z$  are said to *form a Markov chain in that order*

$$X \rightarrow Y \rightarrow Z \quad (1)$$

if and only if  $p(x|y, z) = p(x|y)$  for all  $x$ ,  $y$  and  $z$ . This is equivalent to requiring  $X$ ,  $Z$  are conditional independent on  $Y$ :

$$p(x, z|y) = p(x|y)p(z|y) \quad (2)$$

Here is an example: let  $X$  be a random variable taking the values  $\mathcal{X} = \{-1, 0, 1\}$  with probabilities

$$\begin{array}{c|ccc} X & -1 & 0 & 1 \\ \hline p & \frac{1}{4} & \frac{1}{2} & \frac{1}{4} \end{array} \quad (3)$$

Now let  $Y = |X| + W_1$  where  $W_1$  takes the values  $\{0, 1\}$  with equal probabilities. Now the joint distribution is

$$\begin{array}{c|ccc} Y \setminus X & -1 & 0 & 1 \\ \hline 0 & 0 & \frac{1}{4} & 0 \\ 1 & \frac{1}{8} & \frac{1}{4} & \frac{1}{8} \\ 2 & \frac{1}{8} & 0 & \frac{1}{8} \end{array} \quad (4)$$

This gives a marginal distribution

$$\begin{array}{c|ccc} Y & 0 & 1 & 2 \\ \hline p & \frac{1}{4} & \frac{1}{2} & \frac{1}{4} \end{array} \quad (5)$$

Finally let  $Z = Y + W_2$  where  $W_2$  is identical to  $W_1$ . Now the joint distribution for  $X$ ,  $Y$  and  $Z$  is hard to write down since there are three variables, here is an attempt, basically there are three copies of the table, one for each value of  $X$

$$\begin{array}{c|ccccccc} Z \setminus Y & \begin{array}{ccc} X = -1 \\ 0 & 1 & 2 \end{array} & \begin{array}{ccc} X = 0 \\ 0 & 1 & 2 \end{array} & \begin{array}{ccc} X = 1 \\ 0 & 1 & 2 \end{array} \\ \hline 0 & 0 & 0 & 0 & \frac{1}{8} & 0 & 0 & 0 & 0 & 0 \\ 1 & 0 & \frac{1}{16} & 0 & \frac{1}{8} & \frac{1}{8} & 0 & 0 & \frac{1}{16} & 0 \\ 2 & 0 & \frac{1}{16} & \frac{1}{16} & 0 & \frac{1}{8} & 0 & 0 & \frac{1}{16} & \frac{1}{16} \\ 3 & 0 & 0 & \frac{1}{16} & 0 & 0 & 0 & 0 & 0 & \frac{1}{16} \end{array} \quad (6)$$

Finally, the marginal distribution for  $Z$  is

$$\begin{array}{c|cccc} Z & 0 & 1 & 2 & 3 \\ \hline p & \frac{1}{8} & \frac{3}{8} & \frac{3}{8} & \frac{1}{8} \end{array} \quad (7)$$

---

<sup>1</sup>Conor Houghton, [houghton@maths.tcd.ie](mailto:houghton@maths.tcd.ie) please send me any corrections.

Now, consider, as an example,

$$\begin{aligned}
 p(X = 0, Z = 1) &= p(0, 0, 1) + p(0, 1, 1) + p(0, 2, 1) \\
 &= \frac{1}{4} \\
 &\neq p(X = 0)p(Z = 1) = \frac{3}{16}
 \end{aligned} \tag{8}$$

Now consider the conditional case, for example  $Y = 1$ . Since

$$p(x, z|y) = \frac{p(x, y, z)}{p(y)} \tag{9}$$

we have

$$p_{XZ|Y}(0, 1|1) = \frac{p(0, 1, 1)}{p(1)} = \frac{1}{4} \tag{10}$$

with

$$p_{X|Y}(0|1) = \frac{1}{2} \tag{11}$$

and

$$p_{Z|Y}(1|1) = 2 \left( \frac{1}{16} + \frac{1}{8} + \frac{1}{16} \right) = \frac{1}{2} \tag{12}$$

So, in this case  $p(x|y)p(z|y) = p(x, z|y)$ , as it will be for all  $(x, y, z)$  since this is a Markov chain.
