2E2 Tutorial Sheet 1^1

16 October 2005

Useful formulae:

• The Laplace transform of f(t):

$$\mathcal{L}(f) = \int_0^\infty f(t)e^{-st}dt \tag{1}$$

• Linearity:

$$\mathcal{L}(af + bg) = a\mathcal{L}(f) + b\mathcal{L}(g) \tag{2}$$

where a and b are constants.

• Integration by parts:

$$\int_{a}^{b} u dv = uv \Big|_{a}^{b} - \int_{a}^{b} u dv \tag{3}$$

• Table of Laplace transforms: $\mathcal{L}(1) = 1/s$,

$$\mathcal{L}(t^n) = \frac{n!}{\varsigma^{n+1}} \tag{4}$$

and

$$\mathcal{L}\left(e^{at}\right) = \frac{1}{s-a} \tag{5}$$

• The first shift theorem: if $\mathcal{L}[f(t)] = F(s)$ then

$$\mathcal{L}\left[f(t)e^{at}\right] = F(s-a) \tag{6}$$

• Laplace transform and differenciation: if $\mathcal{L}[f(t)] = F(s)$ then

$$\mathcal{L}(f') = sF - f(0) \tag{7}$$

1. (1) Using the linearity of the Laplace transform, calculate the Laplace transform of

$$f(t) = 2 - \frac{t}{2} \tag{8}$$

2. (1) Using the linearity of the Laplace transform, calculate the Laplace transform of

$$f(t) = 2e^{2t} + 3t + 4e^{-4t} (9)$$

3. (2) The hyperbolic sine is defined as

$$\sinh x = \frac{e^x - e^{-x}}{2} \tag{10}$$

using the linearity of the Laplace transform, show that

$$\mathcal{L}(\sinh at) = \frac{a}{s^2 - a^2} \tag{11}$$

4. (2) Using the shift theorem find the Laplace transform of

$$f(t) = e^{2t}t^2 (12)$$

5. (2) Using the formula for the Laplace transform of the differential find $\mathcal{L}(f')$ where $f=t^2$, check your answer by differentiating f directly and then working out its Laplace transform.
